N-Chloro-N-alkoxycarbamates **1a-d** react with 4-dimethylaminopyridine (DMAP) yielding unknown chlorides of 1-(N-alkoxyamino)-4-dimethylaminopyridines **2a-d**. N-Chloro-N-alkoxyureas **3a-c** with DMAP form N-1-(4-dimethylamino)pyridinium-N-alkoxyureas chlorides **4a-c**. N-Chloro-N-alkoxy derivatives of benzamide **5a,b** and N-*tert*-alkylamine **8** converted in N-pyridinium-N-alkoxycompound **6,9**, respectively, by the action of DMAP. N-Chloro-N-alkoxycarbamates **1a** has been transformed in N-alkoxyhydrazines **10, 11**.

The structures of compounds **2a,b**,  
discussed.

and **4a, 9-11** had been
